

## **Photography Preparation – Frequently Asked Questions.**

### *Question 1:*

When is the difference between JPEG and PSD format?

- Jpeg is a “lossy” format; each time save a jpeg it loses some quality. It produces a smaller compressed file but the layers will become flattened into a single layer.
- Saving as a PSD keeps the layers in tact, allowing you to make additional changes/modifications to either the original file or the modified PSD, but the file size is much larger.
